9	(a)			Indicative content • both ions are free to move in molten state • Al^{3+} ions attracted to negative electrode / move towards negative electrode because opposite charges attract • Al^{3+} ions gain three electrons forming aluminium (atoms) • Al^{3+} ions are reduced • $\text{Al}^{3+} + 3\text{e}^- \rightarrow \text{Al}$ • O^{2-} ions attracted to positive electrode / move towards positive electrode because opposite charges attract • O^{2-} ions lose two electrons forming oxygen (atoms) • two O^{2-} ions lose (four) electrons forming oxygen (molecules) • O^{2-} ions are oxidised • $2\text{O}^{2-} - 4\text{e}^- \rightarrow \text{O}_2$ 5-6 marks Clear understanding of movement of ions and gain/loss of electrons; good attempt at equations <i>There is a sustained line of reasoning which is coherent, relevant, substantiated and logically structured. The candidate uses appropriate scientific terminology and accurate spelling, punctuation and grammar.</i>	6			6
