6 HT	(a)			Indicative content: The National Grid consists of a network of power stations, transformers/sub-stations and power lines all joined together supplying electricity to consumers. Supply and demand is monitored. At times of power station failure electricity can be transferred from one part of the Grid to another. At times of peak demand, reserve generation can increase supply or electricity can be imported from abroad. Transformers are used to step-up the voltage before transmission along power lines. This reduces current and power loss as heat in the cables.	6			6

	(b)	(i)		$63 - 1.42 = 61.58$ or $63\,000 - 1\,420 = 61\,580$ (1) Substitution: $\frac{61.58 \text{ ecf}}{63} \times 100$ or $\frac{61\,580 \text{ ecf}}{63\,000} \times 100$ (1) % efficiency = 97.7[5] (1) Alternative (example of a wasted energy route): $\frac{1.42}{63} = 0.0225$ (1) $0.0225 \text{ ecf} \times 100 = 2.25\%$ (1) so % efficiency = $100 - 2.25 = 97.7[5]$ (1) Alternative (max demand off the winter curve): $55\,000 - 1\,420 = 53\,580$ (1) $\frac{53\,580 \text{ ecf}}{55\,000} \times 100$ (1) So % efficiency = 97.4 (1) Alternative (max demand off the summer curve): $(43\,000 \pm 1\,000) - 1\,420 = 41\,580$ (1) $\frac{41\,580 \text{ ecf}}{43\,000} \times 100$ (1) So % efficiency = 96.7 (1) Alternative (calculating input energy) Useful energy = 63 000 [MW] Input energy = $63\,000 + 1\,420 = 64\,420$ [MW] (1) $\frac{63\,000}{64\,420 \text{ ecf}} \times 100$ (1) So % efficiency = 97.8 (1) N.B.1 If in any of the above methods 1 420 has not been subtracted then award no marks	1	1		3	3

				N.B.2 $63\,000 - 1\,420 = 61\,580$ (1) $\frac{61\,580}{79\,900}$ no further credit to be given and for $\frac{63\,000}{79\,900}$ no credit to be given N.B.3 Attempt at subtracting 1 420 MW from 63 GW or 79.9 GW where the conversion is incorrect award 1 mark only provided the outcome is positive N.B.4 Ignore rounding errors on the % value Accept - If output capacity used $79\,900 - 1\,420 = 78\,480$ (1) $\frac{78\,480}{79\,900} \times 100 = 98.2\%$ (1) so award a maximum of 2 marks						
		(ii)		Substitution: $\frac{360\text{ TWh}}{8\,766\text{ h}}$ (1) Conversion i.e. $\frac{360\,000}{8\,766}$ (1) = 41[.1] [GW] (1)	1	1 1		3	3	
		(iii)		Ticks in boxes 1 and 3 (for 1 mark each) i.e. At maximum demand there is spare capacity of 16.9 GW (1) The difference in minimum demand between summer and winter is approximately 10 000 MW (1) Lose 1 mark for each extra tick			2	2
