

6. (a) State what is meant by the work function, ϕ , of a metal surface. [1]

.....

.....

(b) Sodium will undergo the photoelectric effect when illuminated by visible light, but zinc requires ultraviolet radiation. **Explain** which material has the greater work function. [1]

.....

.....

(c) (i) Use Einstein’s photoelectric effect equation to show that the maximum wavelength, λ_{max} , for emission is given by the equation: [2]

$$\lambda_{\text{max}} = \frac{hc}{\phi}$$

.....

.....

.....

(ii) A mixture of red ($\lambda = 650\text{ nm}$), green ($\lambda = 550\text{ nm}$) and blue ($\lambda = 450\text{ nm}$) light is incident on a metal surface of work function of $3.7 \times 10^{-19}\text{ J}$. Determine which wavelength or wavelengths of light will be **unable** to release electrons from the metal surface. [2]

.....

.....

.....

.....

(iii) Explain, in terms of photons, whether or not the intensity of the light will affect the maximum kinetic energy of the released electrons. [2]

.....

.....

.....
