6				Indicative content: Apparatus used: Balance, measuring cylinder or displacement can Description of the method: Use a balance to weigh the [dry] rock and record its mass (in grams). Fill a measuring cylinder with water up to 20 cm³ (typically) and record its volume. Gently place the rock into the measuring cylinder and record the new volume. OR Fill a displacement can to its spout and place a measuring cylinder beneath its spout. Gently place the rock into the can, collect all displaced water and record the volume. Calculating the density: Calculate the volume of the solid by subtracting the original volume from the new volume (in cm³) OR Measure the volume of water in the measuring cylinder (in cm³) for the displacement can method. Divide the mass by volume to find its density in g/cm³. 5–6 marks Comprehensively describes all three aspects of the experiment. <i>There is a sustained line of reasoning which is coherent, relevant, substantiated and logically structured. The candidate uses appropriate scientific terminology and accurate spelling, punctuation and grammar.</i>	6			6		6
