5 FT	(a)			Indicative content Blood glucose levels are raised after mealtimes, pancreas secretes insulin, liver converts glucose to <u>glycogen</u>, which is stored in the liver and blood <u>glucose</u> returns to normal. If blood glucose is too low, the pancreas secretes <u>glucagon</u>, and liver convert glycogen into glucose and blood glucose returns to normal. 5-6 marks The candidate correctly describes link between changes in glucose concentration and insulin and glucagon release. Role of pancreas, liver correctly described. <i>There is a sustained line of reasoning which is coherent, relevant, substantiated and logically structured. The candidate uses appropriate scientific terminology and accurate spelling, punctuation and grammar.</i> 3-4 marks The candidate partly described the link between insulin or glucagon release and glucose concentration. They correctly describe the role of the pancreas, liver. <i>There is a line of reasoning which is partially coherent, largely relevant, supported by some evidence and with some structure. The candidate uses mainly appropriate scientific terminology and some accurate spelling, punctuation and grammar.</i>	6					6

				1-2 marks The candidate describes that glucose levels rise after a meal and decreases at other times. <i>There is a basic line of reasoning which is not coherent, largely irrelevant, supported by limited evidence and with very little structure. The candidate used limited scientific terminology and inaccuracies in spelling, punctuation and grammar.</i> 0 marks No attempt made or no response worthy of credit.						
	(b)			any 2 × (1) from: control/low sugar diet (1) <u>insulin</u> injections (1) pancreatic tissue transplant (1)	2					
	(c)	(i)		Benedict's test (1) Boil/heat (1)	2					
		(ii)		(blue→) green / amber / (brick) red (1) Blue/no colour change (1)	2
