6			Indicative content: In unpolarised light vibrations are in all directions, at right angles to direction of travel and the sequence of directions is random. To distinguish, view light through polaroid and rotate it. Light is unpolarised if intensity / brightness doesn't depend on the angle of the polaroid. Light is polarised if it does depend on the angle of the polaroid. Polaroid decreases the intensity of unpolarised light [equally whatever the angle of the polaroid]. For polarised light there are two angles of extinction per turn of the polaroid (or similar detail). (Not complete extinction if light only partially plane polarised). 5-6 marks Comprehensive account given of what is unpolarised light AND how to determine if light is polarised or not. <i>There is a sustained line of reasoning which is coherent, relevant, substantiated and logically structured.</i> 3-4 marks Limited description given of what is unpolarised light and how to determine if light is polarised or not OR comprehensive account of how to determine if light is polarised or not. <i>There is a line of reasoning which is partially coherent, largely relevant, supported by some evidence and with some structure.</i> 1-2 marks Limited description given of either what is unpolarised light OR how to determine if light is polarised OR comprehensive account of what is unpolarised light <i>There is a basic line of reasoning which is not coherent, largely irrelevant, supported by limited evidence and with very little structure.</i> 0 marks No attempt made or no response worthy of credit.	6			6		6
