

10. The crystallisation of sodium ethanoate from a super-saturated solution is used to release heat in reusable hand warmers.

- (a) A super-saturated solution of sodium ethanoate was made by dissolving 320 g of hydrated sodium ethanoate ($\text{CH}_3\text{COONa} \cdot 3\text{H}_2\text{O}$) in 60 cm^3 of hot water. It was then allowed to cool to room temperature, which was measured as 17°C .

A thermometer was added to the solution, which caused the sodium ethanoate to start crystallising. The temperature of the process was recorded every 30 seconds for 3 minutes. The results are shown below:

Time/s	Temperature/ $^\circ\text{C}$
0	17
30	27
60	35
90	41
120	40
150	39
180	38

- (i) Plot the results on the graph paper below.

[2]

Temperature / °C

Time / s

- (ii) Use your graph to calculate the maximum temperature change for this crystallisation.

[2]

maximum temperature change = °C

- (iii) Use the **total mass** of the sodium ethanoate solution and the temperature change from the graph to calculate the enthalpy change of crystallisation per mole of sodium ethanoate. Assume the density of water is 1.00 g cm^{-3} and the specific heat capacity of sodium ethanoate solution is $4.18 \text{ J K}^{-1} \text{ g}^{-1}$.

$$M_r(\text{CH}_3\text{COONa} \cdot 3\text{H}_2\text{O}) = 136 \quad [4]$$

enthalpy change = kJ mol^{-1}

- (iv) Suggest a reason why the experimental enthalpy change is often lower than the theoretical enthalpy change. [1]

.....
.....

- (b) Sodium ethanoate can be made in a neutralisation reaction. Complete the following equation: [2]

- (c) The carboxylic acid used to produce sodium ethanoate can be produced using an oxidation reaction.

- (i) Name the reagents and give the expected observations. [2]

.....
.....
.....

- (ii) A student proposed that the apparatus below should be used to perform this oxidation reduction experiment.

The teacher said that this would not work and would be unsafe. Draw a labelled diagram of the apparatus that should be used in this experiment. [3]
