5. The National Grid includes a large network of cables that connects power stations to homes.

(a) Describe the purpose of transformers A and B in the National Grid.

Include in your answer:

- how electrical energy is transmitted **efficiently**
- how electrical energy is transferred **safely** to homes.

- (b) Some houses have solar panels on their roof.  
They produce electricity.  
Explain why these houses are still connected to the National Grid. [2]

.....

.....

.....

- (c) A housing development of 20 new houses needs to be connected to the National Grid.  
Each house requires a **maximum current of 60 A**.

- (i) Calculate the total current needed if all 20 houses are using the maximum current. [1]

Total current = ..... A

- (ii) The mains voltage in the houses is 230 V a.c.

I. Use the equation:

power = voltage × current

to calculate the maximum total power supplied to the 20 houses. [2]

Maximum power = ..... W

- II. Convert your answer for the maximum power into kW. [1]

Maximum power = ..... kW
