

2. Microwaves travel through space at a speed of 3×10^8 m/s and are one part of the electromagnetic spectrum.

(a) The diagram represents microwaves produced at a certain frequency.

- (i) Use the information in the diagram to calculate the wavelength of these microwaves. [1]

Wavelength = cm

- (ii) Use your answer above and the equation:

$$\text{wave speed} = \text{wavelength} \times \text{frequency}$$

to calculate the frequency of these microwaves. [3]

Frequency = Hz

- (b) Microwaves are refracted as they travel from the atmosphere into space.

Complete the diagram to show the refracted wavefronts in space.

[3]

- (c) Geostationary artificial satellites are used to send microwave signals around the world.

- (i) Explain why a satellite in a geostationary orbit above the equator appears to stay in a fixed place above the surface of the Earth even though both the satellite and the Earth are constantly moving.

[2]

.....

.....

.....

- (ii) The diagram shows 4 satellites in geostationary orbit around the Earth. A signal is to be sent from Earth station **P** to **Q** using the satellites 1 and 2. The first and last parts of the path are shown.

Diagram not to scale

Use an equation from page 2 to calculate the time taken for the signal to travel from **P** to **Q**.

The height of a geostationary satellite above the Earth is 3.6×10^7 m.

(Speed of light, $c = 3 \times 10^8$ m/s)

[3]

Time = s

- (iii) It was suggested that if the signal had been sent in the opposite direction from **Q** to **P** via satellites **3** and **4** then it would have arrived quicker.

Explain whether you agree with this suggestion.
