

7. The waves from an earthquake can be monitored by seismological stations located on the surface of the Earth.

The diagram shows circles drawn around three seismological stations **A**, **B** and **C** in Mid and North Wales. The radius of each circle shows the distance of the epicentre from each station.

- (a) (i) **Label on the diagram** with a cross (X) the location of the epicentre. [1]
- (ii) Explain why at least three seismological stations are needed to locate the epicentre. [2]

.....

.....

.....

- (b) Explain which station (**A**, **B** or **C**) detected the earthquake first. [2]

.....

.....

.....

- (c) The diameter of the circle around station A **is double** the diameter of the circle around station B.

The earthquake happened at 1 hour : 15 minutes : 10 seconds (1:15:10) in the morning.

The following signals were obtained at stations **A** and **B**.

Due to an error on the equipment the **arrival times** (T1 and T2) for the two signals were not recorded at station **B**.

Using signal information from station **A**, determine the times that the P waves and the S waves arrived at station **B**. Explain how you arrived at your answers. [3]

.....

.....

.....

Arrival time of P waves (T1) = hours minutes seconds.

Arrival time of S waves (T2) = hours minutes seconds.
