

5. Nuclear power in the U.K. provides around one sixth of our total electricity. It is important as it provides a constant and reliable source of electricity to help supply the base load demand for the National Grid. The incomplete nuclear equation below shows one possible fission reaction of uranium, U.

- (a) **Complete** the nuclear equation above. [2]

- (b) (i) Name the particle that is absorbed by the uranium-235 nucleus. [1]

- (ii) In a nuclear reactor on average two of the three particles, ${}_0^1\text{n}$, which are produced in one fission are absorbed by the **control rods**. Explain why this allows the nuclear reactor to operate safely. [2]

- (c) The use of nuclear power is controversial and some people believe that we should not build any new nuclear power stations because of the radioactive waste that they produce. State **two** properties of nuclear waste which makes storage a problem. [2]

1.

2.

- (d) The pie chart below shows the sources of background radiation near a nuclear power station.

- (i) State how the pie chart suggests that nuclear power is a safe source of electricity. [1]

.....

.....

- (ii) Students measure the background radiation in counts per minute. One group takes a measurement for one minute. A second group measures the counts for 10 minutes and divide the value by 10. Explain which method is better. [2]
