4. FT				Indicative content: Light: - Initially the rate of photosynthesis increases (linearly) with increasing light intensity. - Gradually the rate levels off - and at after 2/3 units the rate of photosynthesis stays constant. Temperature: - The higher the temperature then the greater the rate of photosynthesis, - It reaches a maximum rate at about 30°C - Then the rate slows down to zero at 50°C. Carbon dioxide: - The rate of photosynthesis increases (linearly) with increasing carbon dioxide concentration at first. - Gradually the rate levels off - and after 3/4 units the rate of photosynthesis stays constant. 5-6 marks All three variables described with some numerical data from all areas. <i>There is a sustained line of reasoning which is coherent, relevant, substantiated and logically structured. The candidate uses appropriate scientific terminology and accurate spelling, punctuation and grammar.</i>		6		6		6
