

-
- The diagram shows a physics experiment setup. A squash ball is positioned at the top of a ramp. The ramp is supported by a clamp stand on the left and rests on a bench on the right. The horizontal distance from the base of the ramp to the end of the bench is marked as 50 cm.

- [6 QER]

- How you would carry out the experiment
- How to reduce the uncertainty in your results.

- (b) The following readings were taken during the investigation.

Time to travel 50 cm along the bench = 2.0 s

Time to reach the bottom of the ramp = 2.5 s

- (i) Use the equation:

$$\text{velocity} = \frac{0.5}{\text{time to travel 50 cm along the bench}}$$

to calculate the velocity of the ball travelling along the bench.

[2]

velocity = m/s

- (ii) Use the equation:

$$\text{acceleration} = \frac{\text{velocity along the bench}}{\text{time to reach the bottom of the ramp}}$$

to calculate the acceleration of the ball down the ramp.

[2]

acceleration = m/s²
