

5. Nuclear medicine involves the use of radioactive substances in the diagnosis and treatment of disease. Nuclear medicine records radiation emitted from within the body rather than radiation that is generated by external sources like X-rays. Nuclear medicine scans differ from radiology as the emphasis is not on imaging but on organ function.

Information about some isotopes that emit gamma (γ) rays is given in the table.

Radioisotope	Half-life	Energy of γ rays
caesium-137	30.17 years	0.662 MeV
cobalt-60	5.26 years	1.17 MeV
iodine-125	59.6 days	31.4 keV
thallium-201	73.0 hours	71.0 keV
palladium-103	17.0 days	21.0 keV

- (a) (i) Describe the nature of a gamma (γ) ray.

[2]

.....

.....

.....

- (ii) Explain why radioisotopes that emit gamma rays are suitable for examining organ function when injected into the body.

[2]

.....

.....

.....

- (iii) Explain which is the most suitable radioisotope from the table to inject into the human body as part of a gamma camera investigation.

[2]

.....

.....

.....

- (b) In order to treat prostate cancer, palladium-103 pellets are placed directly into the prostate gland. They remain permanently in place. The gamma emissions from the pellets are almost undetectable when their activity drops to $\frac{1}{32}$ of its original value. Calculate the time taken for this reduction to occur. [4]

Time = days
