3. The abundance of a species in a habitat can be investigated by using quadrats for random sampling.

(a) Describe how you would use a quadrat to investigate the population of snails in a habitat. [3]

.....

.....

.....

.....

.....

(b) The results of an investigation into the variety of snails found in two habitats are shown below. Each quadrat measured 1 m by 1 m. The area of habitat **X** was 12 m² and the area of habitat **Y** was 15 m².

Habitat X

Quadrat	Number of snails				Total number of snails
	Species A	Species B	Species C	Species D	
1	0	2	3	1	6
2	0	0	3	2	5
3	0	1	3	1	5

Habitat Y

Quadrat	Number of snails				Total number of snails
	Species A	Species B	Species C	Species D	
1	0	0	1	2	3
2	0	0	4	3	7
3	0	0	1	3	4

(i) Use the data to compare the distribution of snail species in the two habitats. [4]

(ii) One student claims the investigation is not valid as the area of the habitats was not the same. Explain whether you agree with the claim. [1]
