

6. Levels of bacteria in milk are routinely monitored.

(a) Most milk sold to consumers is pasteurised and homogenised.

(i) Explain why milk is pasteurised.

[2]

.....

.....

.....

(ii) Describe the process of homogenisation and explain why it is carried out.

.....

(b) Scientists investigated four types of milk. They monitored the growth of bacterial colonies on agar plates using 0.1 cm^3 from each type of milk over two days. Their results are shown below.

Type of milk	Heat treatment	Number of bacterial colonies in a 40 cm^3 serving
raw	none	24 000
traditional pasteurised	63°C for 30 minutes	
flash pasteurised	78°C for 35 seconds	1600
ultra-high temperature pasteurised (UHT)	135°C for 2 seconds	none

- (i) Complete the table.

[2]

Space for working

- (ii) Unopened UHT milk can be stored on supermarket shelves at room temperature for six months but unopened pasteurised milk must be stored in a refrigerator at 4°C or below for no longer than seven days. Explain these differences.
