- (ii) The recent red tide has killed approximately 500 turtles, as they ingest the algae when they feed on sea grasses. Prior to this, the population of turtles in Florida waters was estimated at 51 000. Calculate the percentage of turtles that have died as a result of red tide. **Give your answer to two significant figures.** [3]

Percentage of turtles killed = %

- (b) Dead zones are areas of water with reduced oxygen levels. Some scientists have argued that the red tide can lead to dead zones forming in the sea. Explain how the increase in algal growth described in the article could lead to dead zones. [5]
