

The graph shows the total annual catch of cod and the stock of adult fish remaining in the North Sea from 1965 to 2015.

- (i) The safe stock is 150 000 tonnes.

Use a ruler to draw a straight line on the grid to show the safe stock, from 1965 to 2015. [1]

- (ii) Use the data in the graph to answer the following questions.

- I. Calculate the **difference in mass** between the total catch in 1982 and the safe stock. [2]

Difference in mass = thousand tonnes

- II. One tonne contains 120 adult cod.
Calculate the number of adult cod in the safe stock. [2]

Number of adult cod in the safe stock =

Examiner
only

(iii) Describe the evidence that:

I. shows overfishing beyond a sustainable level took place between 1971 and 2005; [2]

.....

.....

.....

.....

II. supports the prediction made by scientists in 1996, that ‘*without action there would be no adult cod in the North Sea by 2015*’; [1]

.....

.....

III. shows the fishing quota of 2005 had an effect on the cod population. [1]

.....

.....

(c) Maintaining biodiversity ensures a continued food supply for humans. [1]
Give **one other** benefit to humans of maintaining biodiversity.
