summer

grasping feet
with claws

large eyes for
seeing in dim light

- Dormice are nocturnal (active only at night).
- In summer, they live high up in trees and bushes, eating berries and insects.
- In winter, they hibernate (being completely inactive) and keep warm in nests at ground level.
- Between the years 2000 and 2020 the dormouse population in the UK decreased and it became an endangered species in some areas.
- In 2000, as part of a local action plan, 1 000 dormice were released into an area and their numbers later increased to 1 050.

Use the information to answer the following questions.

(a) State **one** way in which the dormouse **body structure** is adapted to: [3]

(i) survive in low temperatures;

.....

(ii) climb in branches of trees;

.....

(iii) look for food at night.

.....

Examiner
only

(b) State **one** way in which the **behaviour** of the dormouse helps it to survive in its environment.

[1]

(c) Using the information, complete the table by writing true or false for each statement. [4]

Statement about the hazel dormouse	True or false
Its habitat is woodland.	true
It eats only plants.	
The species became extinct in the UK in 2020.	
It does not hunt for food in daylight.	
As a result of a local action plan, numbers increased by 5%.	
It belongs to the genus <i>Muscardinus</i> .
