

SECTION BAnswer **all** questions.

8. On heating, calcium hydroxide decomposes to produce calcium oxide and water.

The enthalpy change of this reaction cannot be measured directly.

Both calcium hydroxide and calcium oxide react with dilute hydrochloric acid and enthalpy changes can be found for the reactions. Hess's law can then be used to determine ΔH_1 .

Describe the practical steps you would carry out and how you would use Hess's law to determine the enthalpy change for the decomposition of calcium hydroxide, ΔH_1 .

You should state clearly what needs to be measured but you should **not** calculate any values.
