

4. Marble chips (calcium carbonate) react with hydrochloric acid to produce carbon dioxide gas as shown in the equation.

Graph **A** shows the volume of carbon dioxide produced over 6 minutes when the reaction was carried out at 30 °C.

- (a) (i) Find the volume of carbon dioxide given off after 2 minutes. [1]

..... cm³

- (ii) Find the time taken for the reaction to finish. [1]

..... minutes

- (iii) At which of the following points on graph **A** is the reaction at its fastest?

Tick (✓) the correct box.

[1]

1

☐

2

☐

3

☐

- (iv) After $\frac{1}{2}$ minute, 7.5 cm^3 of carbon dioxide has been produced.

Use the equation to calculate the mean rate of reaction over this time in cm^3/s .

[2]

$$\text{mean rate} = \frac{\text{volume of carbon dioxide produced}}{\text{time (in seconds)}}$$

Mean rate = cm^3/s

- (b) (i) Graphs **B**, **C** and **D** on the grid below show the results for the experiment carried out at **different** temperatures. Graph **A** for the reaction carried out at 30 °C is also shown.

State which of graphs **B**, **C** and **D** shows the results for the experiment carried out at a temperature of 40 °C. [1]

Graph

- (ii) Using your knowledge of particle theory, underline the correct words in the brackets to complete the following sentence. [2]

At a higher temperature, the particles will have

(**more** / less / the same amount of) energy, so they will move faster and

there will be (an equal / a smaller / a greater) number of successful

collisions per second.
