7				Indicative content Description - magnesium atom loses its 2 outer shell electrons - becomes a positive ion - both chlorine atoms gain an electron - become negative ions - attraction between the oppositely charged ions  Explanation - they transfer electrons to gain full outer shell electrons - high melting point due to strong bonds between the ions requiring lots of energy to split them - it conducts electricity when molten or in solution because only then are the charged ions are free to move and carry the electrical charge / it does not conduct when solid as ions are immobile	4	2		6
