

Question				Marking details	Marks available					
					AO1	AO2	AO3	Total	Maths	Prac
9	(a)			$1s^2 2s^2 2p^6 3s^2 3p^6 3d^6 (4s^0)$ (1) partially-filled d-orbitals (1)	1	1		2		
	(b)			award (1) for either of following the energy of the (4s and) 3d-orbitals are all similar the ionisation energies to remove the (4s and) 3d-electrons are similar	1			1		
	(c)			 must show clear octahedral structure with bonds between Fe and O atoms in water	1			1		
	(d)	(i)		different ligands cause different amount of d-orbital splitting (1) so different frequencies/wavelengths of light are absorbed (and different frequencies/wavelengths are transmitted/reflected) (1)	1	1		2		
		(ii)		find a wavelength absorbed by $[\text{Fe}(\text{H}_2\text{O})_6]^{3+}$ but not by $[\text{Fe}(\text{H}_2\text{O})_5(\text{OH})]^{2+}$ / any other species in the mixture		1		1		1

Question				Marking details	Marks available					
					AO1	AO2	AO3	Total	Maths	Prac
		(iii)		$K_c = \frac{[\text{H}^+][\{\text{Fe}(\text{H}_2\text{O})_5(\text{OH})\}^{2+}]}{[\{\text{Fe}(\text{H}_2\text{O})_6\}^{3+}]}$ (1) unit $\Rightarrow$ mol dm ⁻³ (1)		1 1		2	1	
		(iv)		$[\text{H}^+] = 0.0282 \text{ mol dm}^{-3}$ (1) $[\text{Fe}(\text{H}_2\text{O})_6]^{3+} = \frac{0.103 \times 0.0282}{4.03 \times 10^{-3}}$ (1) $[\text{Fe}(\text{H}_2\text{O})_6]^{3+} = 0.720$ (1) mass of FeCl ₃ .6H ₂ O = (0.720 + 0.103) × 270.4 = 222.5g (1)		1	3	4	3	
(e)	(i)			[Fe(H ₂ O) ₃ (OH) ₃] or Fe(OH) ₃ brown / red-brown / dark brown formula and colour needed	1			1		1
		(ii)		<u>oxygen</u> (from the air) can oxidise <u>Fe²⁺</u> to Fe ³⁺ (turning the precipitate brown) (1) award (1) for either of following - because oxygen has a more positive standard electrode potential than Fe³⁺ so it is a stronger oxidising agent - the EMF for the reaction between O₂ and Fe²⁺ is positive / +0.46V and positive reactions are feasible		1	1	2		1

Question				Marking details	Marks available					
					AO1	AO2	AO3	Total	Maths	Prac
		(iii)		electrode potential will be less positive / more negative (1) must attempt reason to gain this mark alkaline solution will reduce concentration of H ⁺ so equilibrium will move to left (1)			2	2		
	(f)	(i)		$\text{Fe}_2\text{O}_3 + 3\text{CO} \rightarrow 2\text{Fe} + 3\text{CO}_2$		1		1		
		(ii)		CO has carbon in +2 oxidation state but the stable oxidation state of carbon is +4	1			1
