

5. On detonation, the explosive RDX produces carbon monoxide, steam and nitrogen.

RDX
 M_r 222

Calculate the mass of RDX that would give 1.00 m^3 of gaseous products measured at 100°C and at 1 atm. Give your answer to an **appropriate** number of significant figures. [2]

(1 mol of any gas occupies a volume of 30.6 dm^3 under these conditions)

Mass of RDX = g

10
