

11. (a) Tyrosine is one of the amino acids making up casein, the protein in milk.

tyrosine

- (i) Using a particular solvent tyrosine has an R_f value of 0.67.

On the chromatogram below show the spot given by tyrosine.

[1]

(ii) Write the formula for the zwitterion of tyrosine.

[1]

(iii) Tyrosine is described as a hydrophobic amino acid, as its solubility in water is very low.

Use the formula of tyrosine to give a reason for this low solubility.

[1]

.....

.....

.....

- (iv) Amino acids, such as tyrosine, react with nitric(III) acid to give the corresponding hydroxy acid and nitrogen gas.

- I. A sample of tyrosine was treated with an excess of nitric(III) acid and produced 147 cm^3 of nitrogen, measured at 298 K and 1 atm pressure.

Show that this volume of nitrogen will be produced from 1.09 g of tyrosine.

[2]

- II. The experiment was repeated with a sample of tyrosine from a different batch.
This time the same starting mass gave 132 cm^3 of nitrogen under the same conditions.

Suggest **one** reason for this different result.

[1]

.....
.....

- (b) There is increasing interest in the production of important chemicals by biotechnology, rather than from the use of fossil fuels.

One of these compounds is butane-1,4-dioic acid, which can be made from glucose.

In practice, a constant pH is maintained by the addition of calcium hydroxide. As butane-1,4-dioate ions are produced they react with calcium hydroxide to give insoluble calcium butane-1,4-dioate, which is then filtered from the mixture.

- (i) Calculate the atom economy for the production of calcium butane-1,4-dioate. [2]

Atom economy = %

- (ii) In an experiment, 54.0 g of glucose produced 41.2 g of calcium butane-1,4-dioate.

Calculate the minimum volume of sulfuric acid, of concentration 2.5 mol dm^{-3} , necessary to convert all the calcium butane-1,4-dioate into butane-1,4-dioic acid.

[2]

Volume of sulfuric acid = cm^3

- (c) Hexa-2,4-diene is one of the important products that can be produced from butane-1,4-dioic acid.

hexa-2,4-diene

Use the formula to help you to describe the ^{13}C NMR spectrum of this compound.

Your answer should include the number of peaks seen and your reasoning.
The position and size of the peaks is not required.
