

Answer **all** questions.

1. (a) (i) The box below contains the names of some common types of smart material.

photochromic pigment

hydrogel

shape memory alloy

shape memory polymer

thermochromic pigment

Choose from the box the type of smart material that is used in:

- I. disposable nappies,

[1]

.....

- II. lenses for sunglasses.

[1]

.....

- (ii) What must be done to a thermochromic pigment for it to change colour?

[1]

Tick (✓) the box next to the correct answer.

heat it

☐

add water

☐

place it in sunlight

☐

- (b) (i) The following diagram shows a giant ionic structure.

Giant ionic structures have high melting points and conduct electricity when dissolved or molten.

Use the diagram and your knowledge to draw **one** line from each property to its correct explanation. [2]

Property

Explanation

high melting point

conducts electricity when
dissolved or molten

ions are regularly arranged

strong bonds between ions

ions are free to move

ions cannot move

weak bonds between ions

(ii) The following diagram shows a simple covalent structure.

Simple covalent structures have low melting points and do not conduct electricity.

Use the diagram and your knowledge to draw **one** line from each property to its correct explanation. [2]

Property

Explanation

low melting point

does not conduct electricity

strong forces between molecules

molecules cannot move

weak forces between molecules

molecules are not charged

molecules are tightly packed

- (c) Diamond and graphite have giant covalent structures. Diamond is commonly used in drill tips, whereas graphite is used in pencils.

drill tips

pencils

Use your knowledge of the properties of diamond and graphite to underline the correct word in the brackets to complete each sentence. [2]

Diamond is used in drill tips because it is (**hard** / soft / malleable) and has a high melting point.

Graphite is used in pencils because the layers of atoms are held together weakly and are able to slide (**through** / into / over) each other.
