7.	(a)			Indicative content Trends - boiling temperatures increase down the groups - boiling temperature of HF is anomalous - Group 7 hydrides higher boiling temperatures than those of Group 4 Explanation - the stronger the intermolecular force the higher the boiling temperature - going down a group the number of electrons increases so van der Waals forces / induced dipole-induced dipole forces get stronger - HF has hydrogen bonds between molecules - hydrogen bonds are stronger than van der Waals forces so boiling temperature is much higher than expected - Group 7 hydrides are more polar so dipole-dipole forces present and these are stronger than induced dipole-induced dipole forces in Group 4 hydrides 5-6 marks Trend down the groups and HF anomaly identified; trend from Group 4 to Group 7 identified; fully explained <i>The candidate constructs a relevant, coherent and logically structured method including all key elements of the indicative content. A sustained and substantiated line of reasoning is evident and scientific conventions and vocabulary are used accurately throughout.</i> 3-4 marks Trend down the groups and HF anomaly identified; attempt at explanation with reference to more than one type of intermolecular force <i>The candidate constructs a coherent account including most of the key elements of the indicative content. Some reasoning is evident in the linking of key points and use of scientific conventions and vocabulary are generally sound.</i>	3	2	1	6
