7				Indicative content Description • magnesium atom loses its 2 outer shell electrons • becomes a positive ion • both chlorine atoms gain an electron • become negative ions • attraction between the oppositely charged ions  Explanation • they transfer electrons to gain full outer shell electrons • high melting point due to strong bonds between the ions requiring lots of energy to split them • it conducts electricity when molten or in solution because only then are the charged ions are free to move and carry the electrical charge / it does not conduct when solid as ions are immobile	4	2		6
