7				Indicative content Description - the metals get more reactive / react more violently as you go down the group - lithium fizzes and moves slowly on water surface - sodium fizzes, moves quickly on surface, forms a ball and melts - potassium fizzes, moves quickly on surface, forms a ball, melts and ignites burning with a lilac flame Explanation - the metals all have one electron in their outer electron shell - they lose this outer electron when they react - as you go down the group, the outer electron gets further away from the nucleus, meaning it is easier to lose - the more easily the outer electron is lost, the more reactive the metal is	6			6		3
				5-6 marks Full description of the observations and explanation of trend in terms of ease of losing outer electron <i>There is a sustained line of reasoning which is coherent, relevant, substantiated and logically structured. The candidate uses appropriate scientific terminology and accurate spelling, punctuation and grammar.</i> 3-4 marks Good account of the observations, correct trend and reference to electronic structure <i>There is a line of reasoning which is partially coherent, largely relevant, supported by some evidence and with some structure. The candidate uses mainly appropriate scientific terminology and some accurate spelling, punctuation and grammar.</i> 1-2 marks Basic description of some observations and/or trend <i>There is a basic line of reasoning which is not coherent, largely irrelevant, supported by limited evidence and with very little structure. The candidate uses limited scientific terminology and inaccuracies in spelling, punctuation and grammar.</i> 0 <i>No attempt made or answer worthy or any credit.</i>
