

4. (a) A modern version of Young's double slit experiment is set up as shown.

Diagrams not
drawn to scale

The array of light sensors is connected to circuitry that displays a graph of light intensity along the line AB.

- (i) Calculate a value for the wavelength of light from the laser.

[3]

.....

.....

.....

.....

.....

.....

.....

- (ii) Each slit is several wavelengths wide. Suggest why the intensity of the bright fringes decreases the further the fringes are from the centre of the pattern.

[2]

.....

.....

.....

- (iii) A student suggests that replacing the laser with one that emits near infra-red (that is infra-red just beyond the end of the visible spectrum) will increase the fringe separation.

I. Explain whether or not the student is right. [2]

.....

.....

.....

II. State **one** way in which the fringe separation could be increased without changing the laser. [1]

.....

- (b) More than 200 years ago Thomas Young drew a conclusion from his 'fringes' experiment. It was not generally accepted for several years. State what conclusion Young drew, **and** suggest what needed to be done by the scientific community for the conclusion to be accepted. [3]
