

Answer all questions

1. A simplified energy level system is given for a particular four-level laser system. Electrons are pumped (by means of infra-red radiation) from the ground state to level P, and drop to U, setting up a population inversion.

level P _____
 level U _____ 0.820 eV

level L _____ 0.051 eV
 ground state _____ 0

- (a) (i) Calculate the wavelength of radiation emitted in the transition from level **U** to level **L**. [3]

.....

.....

.....

.....

.....

- (ii) Explain how stimulated emission enables amplification of infra-red radiation of this wavelength. [3]
