

3. (a) (i) State Kepler's 1<sup>st</sup> and 2<sup>nd</sup> laws. [3]

.....

.....

.....

.....

.....

.....

- (ii) Kepler's 3<sup>rd</sup> law can be derived from Newton's gravitational law and the equation for centripetal motion. Show that, for any object in a circular orbit about the Earth:

$$T^2 = \frac{4\pi^2}{GM_E} r^3$$

where  $T$  = the period of orbit,  $r$  = the radius of orbit,  $G$  = the gravitational constant and  $M_E$  = the mass of the Earth. [3]

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

- (b) The radius of the geostationary orbit above the Earth's equator is 42 000 km and the Earth-Moon distance is 380 000 km. Use Kepler's 3<sup>rd</sup> law to calculate the period of the Moon's orbit. [3]

.....

.....

.....

.....

.....

.....

.....

- (c) Estimate the minimum possible orbital period for a satellite orbiting the Earth, stating any assumption that you make (the radius of the Earth is 6 370 km). [3]
