

8. (a) The diagram below shows part of the atomic emission spectrum of hydrogen.

- (i) Use the letter **A** to label the line of longest wavelength on the diagram. [1]
- (ii) Explain why hydrogen atoms emit only certain definite frequencies of visible light. [2]

.....

.....

.....

- (b) The ionisation energy of a hydrogen atom is 2.18×10^{-21} kJ.

- (i) Explain what this statement means. [2]

.....

.....

.....

- (ii) Calculate the minimum frequency of radiation required to ionise a hydrogen atom in its ground state. [3]

Frequency = s^{-1}

- (c) Hydrazine is a compound of hydrogen and nitrogen only. It is a colourless, flammable liquid which was used in various rocket fuels.

0.160 g of hydrazine on vaporisation at 398 K and 1 atm pressure has a volume of 163 cm³.

Calculate its volume at 273 K and 1 atm pressure and hence show that its molecular formula is N₂H₄. [3]

.....
.....

- (d) (i) Draw a dot and cross diagram to show the electron arrangement in hydrazine, N₂H₄. Show outer electrons only. [2]

- (ii) Hydrazine contains polar covalent bonds between nitrogen and hydrogen atoms. State what is meant by a *polar* covalent bond. [1]

.....
.....

- (e) Hydrazine acts as a base in a similar way to ammonia.

Suggest an equation for the equilibrium formed when hydrazine dissolves in water. [1]

.....
