

**SECTION B**

*Answer all questions in the spaces provided.*

8. A student was told that he could prepare chloroethane,  $\text{C}_2\text{H}_5\text{Cl}$ , by mixing ethane with chlorine. He added 2.0 g of ethane to excess chlorine and left the mixture exposed to ultraviolet light for several hours. He was then able to use a university laboratory to see whether chloroethane had been made.

- (a) State an instrumental method by which the sample could be analysed. Explain how this would show that chlorination had occurred. [2]

.....

.....

.....

- (b) State why it is necessary to use ultraviolet light when making chloroethane from ethane. Give equations to show the mechanism for the formation of chloroethane. [4]

.....

.....

.....

.....

.....

.....

.....

- (c) The student found that he had made 1.0 g of chloroethane. Calculate his percentage yield. [3]

Percentage yield = ..... %

- (d) The student was disappointed by the yield he obtained but his teacher told him that the yield was always poor due to other products being formed in this reaction.

Identify **two** other organic products, apart from chloroethane, and explain how they are formed. [2]

.....

.....
