

13. (a) In cold weather the wings of an aeroplane can become covered in ice. For safety reasons the wings must be de-iced.

The liquid ethane-1,2-diol, $\text{CH}_2\text{OHCH}_2\text{OH}$, is used, mixed with water, since this lowers the freezing temperature of water and causes the ice to melt.

- (i) Use the diagram below to show the intermolecular forces that allow ethane-1,2-diol to dissolve in water. [3]

- (ii) Suggest a reason why the addition of ethane-1,2-diol lowers the freezing temperature of water. [1]

.....

.....

(b) Ethane-1,2-diol can be oxidised to ethanedioic acid, $(\text{COOH})_2$.

(i) Suggest an oxidising agent suitable to carry out this reaction. [1]

.....

(ii) Write the equation for this reaction. Use [O] for the oxidising agent. [2]

(iii) To ensure complete oxidation the reagents are refluxed.

Draw and label the apparatus as it is being used in this reaction. [2]

(iv) A sample of the reacting mixture was taken during the reflux process and a mass spectrum was produced. One of the peaks recorded was at m/z 58.

Suggest the identity of the **molecular ion** that gave this peak. [1]

.....

- (v) The reaction can be used to prepare a sample of solid ethanedioic acid. This is generally hydrated as $(\text{COOH})_2 \cdot x\text{H}_2\text{O}$ where x is an integer.

2.00 g of ethane-1,2-diol was oxidised and 3.94 g of hydrated ethanedioic acid was produced.

Calculate the relative molecular mass of hydrated ethanedioic acid and hence the value of x in its formula. [4]

$x = \dots\dots\dots$

- (vi) I. Complete the equation for the reaction which occurs when ethanedioic acid is heated with excess methanol in acidic conditions.

Clearly show the structure of the organic product. [2]

- II. Name the type of functional group present in the organic product. [1]
