

8. (a) Chlorine, bromine and iodine are Group 7 elements.

(i) Describe and explain the trend in reactivity within the group.

[2]

.....

.....

(ii) **X**, **Y** and **Z** are known to be chlorine, bromine and iodine but not necessarily in that order.

A student identifies **X**, **Y** and **Z** by mixing them with solutions of halide salts.

The table shows the observations made.

Element	Sodium bromide	Sodium iodide	Sodium chloride
X	solution turns orange	solution turns brown	no change
Y	no change	no change	no change
Z	no change	solution turns brown	no change

Use the observations to identify elements **X**, **Y** and **Z**.

Explain your reasoning.

- (b) Iron reacts with chlorine gas to form iron(III) chloride according to the equation shown.

Calculate the mass of iron(III) chloride that could be produced using 22.4 g of iron. [2]

$$A_r(\text{Fe}) = 56$$

$$A_r(\text{Cl}) = 35.5$$

Mass = g

- (c) White phosphorus has the formula P_4 . It reacts with chlorine to form phosphorus trichloride, PCl_3 .

Put a number in each box to balance the equation for this reaction. [1]
