

4. Hospitals take great care to prevent patients becoming infected with bacteria such as MRSA. They often display posters such as the one shown below.

Protect patients from MRSA

The infographic is divided into three panels, each illustrating a different way MRSA can enter a patient's body. Each panel features a nurse attending to a patient in a hospital bed, with a circular inset showing the specific risk factor.

- Panel 1 (Left):** A pink circular inset shows a surgical incision with sutures. The text below reads: "Surgery allows bacteria to enter the body".
- Panel 2 (Middle):** A blue circular inset shows a cluster of bacteria. The text below reads: "Bacteria can spread when infection control measures are not taken".
- Panel 3 (Right):** A green circular inset shows a pill bottle and several pills. The text below reads: "Antibiotics save lives but poor prescribing practices put patients at risk".

At the bottom of the infographic, a large green banner contains the text: "Use a combination of infection control measures with every patient to prevent infections".

Surgery allows bacteria to enter the body

Bacteria can spread when infection control measures are not taken

Antibiotics save lives but poor prescribing practices put patients at risk

Use a combination of infection control measures with every patient to prevent infections

Use the information in the poster, and your own knowledge to answer the following question.

Describe effective control measures used to prevent MRSA and explain why infections such as MRSA have become difficult to treat. [6 QER]
